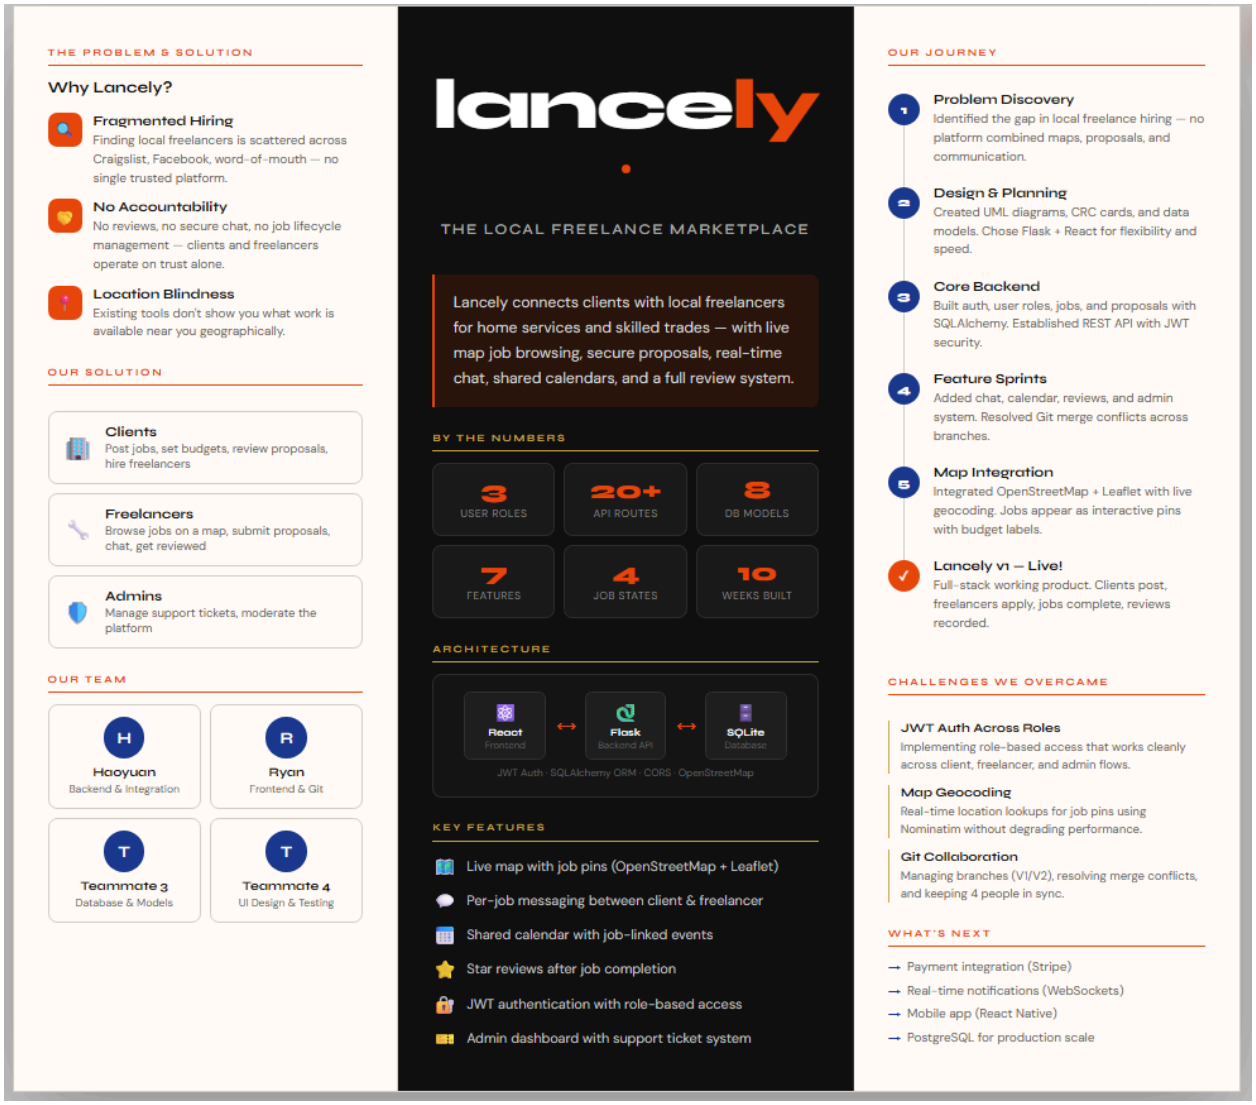
Team 19 release demo presentation items to include.
Ai generated poster idea:



HOW TO RUN THE DEMO

Before the event, have these ready on your laptop:

1. Flask running: `source venv/bin/activate && python app.py`
2. React running: `npm start` (opens at localhost:3000)
3. Two browser windows open side-by-side — one logged in as a **client**, one as a **freelancer**
4. At least 2–3 jobs already posted with locations set
5. The map tab open and visible

THE DEMO FLOW (3–5 minutes)

Step 1 — Hook (30 sec)

> *"Imagine you need a plumber. You post on Craigslist, get 10 random replies, no reviews, no accountability. We built Lancely to fix that."*

Step 2 — Show the Map (45 sec)

- Open the Jobs page and show the **live map with job pins**
- Click a pin → popup shows title, budget, location
- Say: *"Every job is geocoded and pinned in real time using OpenStreetMap."*

Step 3 — Client Posts a Job (30 sec)

- Logged in as client → Post New Job
- Fill in: title, category (e.g. Plumbing), location (e.g. Syracuse NY), budget ($150)
- Submit → watch it appear on the map

Step 4 — Freelancer Applies (30 sec)

- Switch to freelancer window
- Browse jobs → find the one just posted
- Submit a proposal with cover letter and proposed amount

Step 5 — Client Accepts (20 sec)

- Switch back to client
- View proposals → click Accept
- Job status changes from **Open** → **Assigned**

Step 6 — Chat Unlocks (30 sec)

- Show the Messages tab — conversation is now live
- Send one message as client, switch windows and reply as freelancer
- Say: *"Chat is scoped to the job — no spam, no random messages."*

Step 7 — Calendar (20 sec)

- Show calendar → create an event (e.g. "Site Visit — April 25")
- Say: *"Both the client and freelancer see this — it's tied to their job."*

Step 8 — Complete & Review (30 sec)

- Client requests completion → freelancer confirms
- Status → **Completed**
- Leave a star review
- Say: *"Reviews are locked to completed jobs — no fake ratings."*

TALKING POINTS — WHO SAYS WHAT

Split these across your 4 presenters. Each person owns a section.

PRESENTER 1 — The Problem & Idea

"We built Lancely because finding local freelancers is broken. Craigslist has no accountability. Facebook groups are chaotic. There's no single platform that handles the full lifecycle — from finding someone, to hiring them, to paying and reviewing them. Lancely does that.

We focused on home services and skilled trades — plumbers, electricians, cleaners, movers — because that market is huge and underserved by platforms like Upwork or Fiverr, which are built for remote digital work."

PRESENTER 2 — The Tech Stack

"On the backend, we're running Flask with SQLAlchemy for our ORM and SQLite as our database. We have over 20 REST API endpoints covering auth, jobs, proposals, messaging, calendar, reviews, and admin. Authentication is JWT — every protected route verifies the user's token and their role.

On the frontend, it's React — a single-page app that talks to our API. We integrated OpenStreetMap and Leaflet for the live job map, and Nominatim for location autocomplete. Everything is in one codebase — no separate servers needed."

PRESENTER 3 — The Features (Live Demo)

(This person drives the demo on the laptop)

"Let me show you how it works..." → Run through the demo flow above step by step.

"The thing I'm most proud of is the map — it geocodes every job's city and state in real time and drops a pin showing the budget. As a freelancer, you can literally see what work is near you and how much it pays."

PRESENTER 4 — The Journey & Challenges

"We built this over the semester as a 4-person team. The biggest technical challenge was getting role-based access right — a client, freelancer, and admin all hit the same endpoints but see completely different things depending on their JWT token.

We also had real Git challenges — managing two branches, resolving merge conflicts when multiple people edited the same files. That forced us to actually practice the team workflow you learn about in software engineering theory.

If we had more time, we'd add Stripe for payments, WebSockets for real-time chat notifications, and swap SQLite for PostgreSQL for production scale."

HANDLING QUESTIONS

"Why not just use Fiverr?"

> Fiverr is for remote digital work — logos, writing, coding. Lancely is for local physical services. A plumber can't fix your pipes over Zoom.

"How does the map work?"

> We use OpenStreetMap (free, open-source alternative to Google Maps) and Leaflet for rendering. When a job is posted with a city, we call Nominatim's geocoding API to get the coordinates, then drop a custom pin.

"Is it secure?"

> Auth uses JWT tokens with 24-hour expiration. Passwords are hashed with Werkzeug's security utilities. In a production version, we'd move secrets to environment variables and use HTTPS.

"What's the difference between your three user types?"

> Clients post jobs and hire. Freelancers browse and bid. Admins handle support tickets and platform moderation. Every API route checks which type you are before letting you through.

"What would you do differently?"

> We'd separate the frontend into multiple component files earlier — our App.jsx grew to 1,500 lines. Also set up a proper CI/CD pipeline from the start instead of manually resolving Git conflicts.
